STATICS

FORCE

A *force* is a *vector* quantity. It is defined when its **(1)** magnitude, **(2)** point of application, and **(3)** direction are known.

RESULTANT (TWO DIMENSIONS)

The *resultant*, F, of n forces with components $F_{x,i}$ and $F_{y,i}$ has the magnitude of

$$F = \left[\left(\sum_{i=1}^{n} F_{x,i}\right)^2 + \left(\sum_{i=1}^{n} F_{y,i}\right)^2\right]^{1/2}$$

The resultant direction with respect to the x-axis using four-quadrant angle functions is

$$\theta = \arctan\left(\sum_{i=1}^{n} F_{y,i} \Big/ \sum_{i=1}^{n} F_{x,i}\right)$$

The vector form of a force is

$$\boldsymbol{F} = F_x\,\mathbf{i} + F_y\,\mathbf{j}$$

RESOLUTION OF A FORCE

$F_x = F\cos\theta_x$; $F_y = F\cos\theta_y$; $F_z = F\cos\theta_z$

$\cos\theta_x = F_x/F$; $\cos\theta_y = F_y/F$; $\cos\theta_z = F_z/F$

Separating a force into components (geometry of force is known $R = \sqrt{x^2 + y^2 + z^2}$)

$F_x = (x/R)F$; $F_y = (y/R)F$; $F_z = (z/R)F$

MOMENTS (COUPLES)

CENTROIDS OF MASSES, AREAS, LENGTHS, AND VOLUMES

Formulas for centroids, moments of inertia, and first moment of areas are presented in the **MATHEMATICS** section for continuous functions. The following discrete formulas are for defined regular masses, areas, lengths, and volumes:

$r_c = \Sigma\, m_n r_n / \Sigma\, m_n$, where

m_n = the *mass of each particle* making up the system,

r_n = the *radius vector* to each particle from a selected reference point, and

r_c = the *radius vector* to the *center of the total mass* from the selected reference point.

The *moment of area* (M_a) is defined as

$M_{ay} = \Sigma\, x_n a_n$

$M_{ax} = \Sigma\, y_n a_n$

$M_{az} = \Sigma\, z_n a_n$

The *centroid of area* is defined as

$x_{ac} = M_{ay}/A$
$y_{ac} = M_{ax}/A$
$z_{ac} = M_{az}/A$
} with respect to center of the coordinate system

where $A = \Sigma\, a_n$

The *centroid of a line* is defined as

$x_{lc} = (\Sigma\, x_n l_n)/L$, where $L = \Sigma\, l_n$

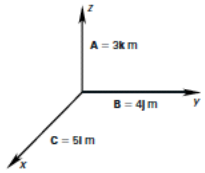
STATICS–1

What is the length of the vector $\mathbf{A}+\mathbf{B}+\mathbf{C}$, the sum of three orthogonal vectors?



(A) 3.5 m (B) 4.3 m (C) 7.1 m (D) 10 m

$$|\mathbf{A}+\mathbf{B}+\mathbf{C}| = \sqrt{A^2+B^2+C^2}$$
$$= \sqrt{(3\text{ m})^2+(4\text{ m})^2+(5\text{ m})^2}$$
$$= 7.07\text{ m} \quad (7.1\text{ m})$$

The answer is (C).

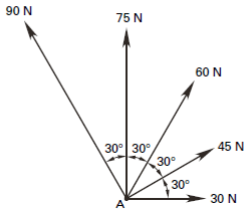
Example Statics Problems

FERM prob. 1, p. 10-6

Problem 1

The five forces shown act at point A. What is the magnitude of the resultant force?



(A) 32 N
(B) 156 N
(C) 182 N
(D) 234 N

Solution

The sum of the forces in the x-direction is

$$\sum F_x = 30\text{ N} + (45\text{ N})\cos 30^\circ + (60\text{ N})\cos 60^\circ + (75\text{ N})\cos 90^\circ + (90\text{ N})\cos 120^\circ$$
$$= 54\text{ N}$$

The sum of the forces in the y-direction is

$$\sum F_y = (30\text{ N})\sin 0^\circ + (45\text{ N})\sin 30^\circ + (60\text{ N})\sin 60^\circ + 75\text{ N} + (90\text{ N})\sin 120^\circ$$
$$= 227.4\text{ N}$$

The resultant force is

$$R = \sqrt{(54\text{ N})^2 + (227.4\text{ N})^2}$$
$$= 233.7\text{ N} \quad (234\text{ N})$$

Answer is D.

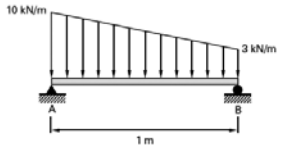
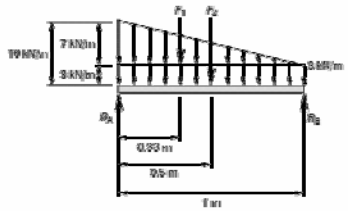
Linear Force System Problem
(EFPRB)

STATICS–25

What is most nearly the reaction force at support B on the simply supported beam with a linearly varying load?



(A) 1.5 kN (B) 2.3 kN (C) 2.6 kN (D) 3.5 kN



$$F_1 = \frac{1}{2}Lh = \left(\frac{1}{2}\right)(1\text{ m})\left(7\ \frac{\text{kN}}{\text{m}}\right)$$
